

Precast Ops — Server Update Checklist

Contacts-first customers + July audit fixes · updates through commit d8858ff (Jul 8, 2026) · Server: LIP-TITAN (192.168.1.20) · Repo: C:\Apps\precastapp

Heads-up before you start: this update permanently removes the Email and Primary Contact columns from the Customer table — that information now lives on each customer's Contacts. The migration automatically converts any remaining header-only contact info into Contact records before dropping the columns, but take a fresh database backup first anyway. Plan for 5–10 minutes of downtime; run it when nobody is entering data.

Update steps (PowerShell on the server, as Administrator)

- ☐ **1. Back up the database.**
& "C:\Program Files\PostgreSQL\18\bin\pg_dump.exe" -h localhost -U postgres -d precastapp -Fc -f C:\Backups\precastapp\pre-contacts-update.dump
Or run scripts\deploy\backup-database.ps1. Keep this file until the update is verified.
- ☐ **2. Stop the app service.**
Stop-Service PrecastApp
- ☐ **3. Pull the new code.**
cd C:\Apps\precastapp
git pull
- ☐ **4. Install dependencies.**
npm ci
Required this time — package.json changed (security dependency overrides).
- ☐ **5. Apply database migrations.**
npx prisma migrate deploy
Expect two new migrations: restrict_product_delete_on_ledger and contact_roles_and_customer_header_drop (this one does the contact backfill + column drop).
- ☐ **6. Rebuild the app.**
npx prisma generate
npm run build
Steps 4–6 can be replaced with: .\scripts\deploy\deploy-app.ps1 -SkipSeed
- ☐ **7. Start the service.**
Start-Service PrecastApp
- ☐ **8. Quick smoke test.**
From a desk PC, open Precast Ops and confirm the Customers page loads with the new columns (Name, Phone, Town, Status). No desktop app reinstall is needed — the Electron shell did not change.

Verify after the update

- ☐ Customers directory shows Name · Phone · Town · Status (Email and Primary Contact columns are gone).
- ☐ Search the directory for a contact's name (a person, not a company) — their company comes up.
- ☐ Open a customer: condensed header with stat strip (Open Jobs / Open Quotes / Unpaid Invoices), contacts listed right below.
- ☐ Edit a contact and tick a role (Estimating / Billing / Field) — a colored chip with a star appears.
- ☐ Start a new quote for that customer — the estimating contact is preselected.
- ☐ Open an invoice — the Billing Contact line shows under Invoice Information.
- ☐ Customers → Import Contacts loads and Parse Preview works on the example rows.
- ☐ Generate one quote PDF (confirms the build + browser path still work).

One-time task after the update: tag contact roles

Existing contacts start with **no roles**. Nothing breaks — quotes and tickets fall back to the Main contact exactly as before — but the app only starts pulling the *right person* for quotes (Estimating), invoices (Billing), and delivery tickets (Field) once roles are assigned. Two ways to do it:

- ☐ **Existing contacts:** open each customer, Edit the contact, tick its roles. The first contact given a role becomes the default (star); click the star on another contact's chip to change it.
- ☐ **New people in bulk:** build an Excel sheet with columns **Customer | Name | Title | Roles | Phone | Email | Notes** and paste it into Customers → Import Contacts. Roles accepts Estimating/Billing/Field (or est, bill, ap, site). Rows must match the customer name exactly; unknown customers and duplicate names are skipped and reported.

If something goes wrong (rollback)

Stop the service, restore the backup, and put the code back to the previous version:

```
Stop-Service PrecastApp
& "C:\Program Files\PostgreSQL\18\bin\pg_restore.exe" -h localhost -U postgres -d precastapp
--clean --if-exists C:\Backups\precastapp\pre-contacts-update.dump
cd C:\Apps\precastapp
git log --oneline # note the commit that was running before the pull
git checkout <previous-commit>
npm ci; npx prisma generate; npm run build
Start-Service PrecastApp
```

Reference: docs\DEPLOYMENT.md (full deployment guide) · COMMANDS.md (command reference). Nightly backups: Windows scheduled task "PrecastApp DB Backup" → C:\Backups\precastapp (30-day retention).
